

# Case study by Dr. Alvin De Leon

**CASE:** 20

**DATE:** May 2011

**CLIENT:** 13 year old right-handed female

**Subjective Complaint:** The client presented with a **cough and hoarseness of her voice** with no fever. She reports that the symptoms began about 5 days ago on Monday night.

**Observation:** The client was observed to have a mild cough with no difficulty breathing and with hoarseness of her voice. She did not present with a fever.

**Organs Affected:** Laryngeal mucosa

**Embryonic germ layer:** ectoderm

**Brain control center:** cerebral cortex (sensory cortex)

**GNM Explanation:** Laryngeal mucosa: a **scare-fright conflict triggered by unexpected danger** causing ulceration of the laryngeal mucosa during the **Conflict-Active Phase**. During the **Healing Phase**, the ulcerated area is replenished with acute swelling and coughing. The client is currently already in the Healing Phase and will need to identify the original conflict (DHS) in order to complete the Biological Special Program and avoid any relapses through **tracks**.

**GNM Understanding:** The client understood the explanation and recognized that her conflict was related to an announcement last Friday in her dance class. She reports that a girl on her dance team injured her foot and would not be available for their performance on Monday and Wednesday. The client states that the whole team had to change their routine unexpectedly and with only one practice before the performance (**her DHS**). It was explained to her that after the performance went well on Monday, she must have felt better about the routine and went into healing. It was also noted that she may have been in a Hanging Healing until Wednesday night which was the last day of the performance. The client understood that she was already in the healing phase and that once she associated the throat symptoms to the “dance conflict”, the Biological Special Program would be completed and her symptoms will slowly subside.

**Results:** The client reported on a follow-up that she was symptom-free within a couple of days from her visit.
